Three different methods were used to determine the size and size distribution of PBCA nanoparticles (nanoparticles formed by anionic emulsion polymerization of butylcyanoacrylate in the presence of poloxamer 188 as a stabilizer).

butyleyarload ylate in the presence of poloxamer 100 as a stabilizer).				
	scanning electron microscopy SEM	dynamic light scattering DLS	analytical ultracentrifugation AUC	
Particle diameter	167 nm	199 nm	184 nm	
advantages	detailed shape and morphological information	short time and low cost	measurements can be obtained at low particle concentrations	
		the movement of particles in a centrifuge (ANUC) shows a stronger size dependence than the diffusion coefficient (DLS)		
disadvantages	risk of changes in particle properties during drying and	measurement will be identical or ~larger	sedimentation of nanoparticles shall be slow enough to obtain
